Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Web site: http://www-seq.wi.mit.edu

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. * However, it should not be assumed that this clone * will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Smit, A.F.A. & Green, P. * NOTE: This is a 'working draft' sequence. It currently
* consists of 11 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Attempts are made to complete double stranded sequence for all regions. All sequence is completed to a standard of coverage with a minimum of 3 reads with no ambiguities. If the sequence coverage for a region does not meet this standard, it is indicated in the amnotation as Low Coverage. Low coverage linakages are verified by PCR product size verification or verification of forward and reverse reads from clones which span the low coverage area.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated average error rate is less than 1 per 10,000 bases using the Consed quality parameters. Regions that do not meet this requirement are annotated as Low Quality.

```

STSS are identified using ePCR (Genome Res. 7:541-550).

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Regions of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < le-34) to EST and cDNA sequences in Unigene. Genes demonstrate at least two exons flanked by consensus splice sites that maintain sequence continuity

CLONE LENGTH: This sequence represents the entire insert of this clone unless otherwise noted. If there are overlapping clones, the overlaps are noted in the beginning and end of the Features

Consensus quality: 1802059 bases at least 020

Consensus quality: 180215 bases at least 020

Consensus quality: 180523; sum-of-contigs estimation

Quality coverage: 0x in Q20 bases; sum-of-contigs estimation

Quality coverage: 3.8x in 020 bases; sum-of-contigs estimation * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a "working draft' sequence. It currently

* Consists of 32 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved. ```
This 12.8 kb DNA sequence spans the region from -6.65 kb relative to the transcriptional start site to +6.15 (located in the third exon) of the murine endothelial growth factor (VEGF) receptor-2 gene (Tk-1). This portion of the Filt-1 gene was isolated from the liver of mouse strain 129/SvJ by screening a phage library of liver flamming region of the gene, in combination with sequences within the 5'-flanking region of the gene, in combination with sequences located within the flirst intron, specifically and reproducibly target expression of heterologous DNA to angloblasts during early stages of vascular development and also to the vasculature of postnatal mice. The regulatory sequences of the first intron also function as an autonomous endothelium specific enhancer when fused to a sutonomous endothelium specific enhancer when fused to a sutonomous several potential binding sites for transcription factors of the Ets and GATA families. The invention provides a cnew claimed recombinant DNA (I) comprising at least one regulatory sequence from an intron of the Fik'l gene, or its homologue, to control expression in endothelial cells, in vivo, linked to (b) a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA containing heterologous sequence controlled by endothelial cell specific regulator - from the Flk-1 gene, used to treat, prevent or diagnose vascular disease, tumours, also to screen

these, or transformed cells, are used to identify agents (A), potential pharmaceuticals, that suppress, activate or enhance transcription of genes in endothelial cells. (I), vectors and (A) are used to direct or prevent (for antisense sequences) expression of genes specifically in endothelial cells, e.g. for treating angiogenesis, cancer, diabetic retinopathy, rheumatoid arthritis etc., and in wound healing, particularly for treating vascular cet., and in wound healing, proliferation of smooth muscle cells, specifically atherosclerosis), tumours and neuronal disorders. They may also be used to induce vascular disease in the transgenic animals or diagnostically, particularly for studying (mal)function, interactions and unregulated expression of endothelial products. (I) provide specific modulation of gene expression in endothelial cells, at all stages of development.
                                                                                                                                                                                                                                                                                                                                                                                                                              8499

                               The present sequence is the coding sequence for Xenopus slit protein. The slit protein is useful for altering or guiding cell migration of neural cells preferably nerve axons or dendrites, leukocytes or malignant cells expressing roundabout (robo) protein, by repulsion or inhibition. Also, the slit protein is useful for treating graft rejection, inhibiting the infection of a cell by HIV, inhibiting inflammation and in aiding wound repair and organ regeneration. In addition, the slit protein is useful for the treatment of conditions involving the migration of leukocytes, such as asthma, arthritis, glomerulonephritis, cystic fibrosis, ulcerative colitis, Crohn's disease, multiple sclerosis, allergic encephalomyelitis, Alzheimer's disease and coronary artery restenosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          repopulating haematopoietic progenitor cells (LTR-HPC), by comparing the expression of tissue transglutaminase (tTGase), a calcium dependent enzyme, in myeloid cells like blood or marrow to a standard. A higher level of tTGase expression compared to background expression, indicates the presence of LTR-HPC in the sample. Tissue TGase catalyses post-translational modification of proteins and is involved in apoptosis, cell adhesion, metastasis and extracellular matrix (ECM) assembly. It acts as a marker that distinguishes the LTR-HPC from other (im)mature
The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype, as well as related diseases.

ö
blood cells and is also useful for improved quantification of a mammal's haematopoietic competence. The method is useful for functional selection of progenitor cells, enabling allogeneis transplant procedures and ex vivo manipulation of HPC for use in gene therapy. The present sequence is an mRNA encoding a homologue of human tTGase, expressed in LTR-HPC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences shown in V29330 to V29371 represent the 47 exons and flanking intronic sequences containing the complete coding region of the human calcium ion channel alpha 1 subunit gene and part of untranslated

sequences. The channel is related to familial hemiplegic migraine (FHM) and/or episodic ataxia type 2 (EA-2) and is derived from, related to or associated with a gene present in humans on chromosome 19p13.1-13.2. The encoding gene can be used to localise or identify genes related to episodic neurological disorders, specifically migraine, FHM or EA-2, but also epilepsy. The isolated or a recombinant nucleic acid can also be used to distinguish between alleles of the corresponding gene. Cells and animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM, EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to

The present invention describes a library of human polynucleotides comprising the sequences given in 21232 to 21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in 212532 to 21779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct therapeutic purposes. The polynucleotides may also be used to construct concoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer, propertial procession in the concoded protein and management of colorectal cancer, breast cancer, and jung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tango-77; human; IL-1ra; cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.

                                                                                                                                                                                            X02956-X03048 and X22301-X22304 are overlapping BAC cenomic sequences containing alternatively spliced forms of human IL-Ira. Such fragments are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-IR). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory bowel disease. It may also induce or suppress interleukins, cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alzheimer's disease; hypobetalipoproteinemia; dysbetalipoproteinemia; ds

This invention describes a novel method for the genetic treatment of hyperlipidemia by altering genes, in hepatocytes, for apoprotein (apo) B, E or Al. Low density lipoprotein (LDL) levels in the blood are reduced by altering an apo B gene (I) in a hepatocyte. The invention describes a method for the therapeutic and/or prophylactic method involving altering an apo E gene in hepatocytes by introducing the mutations Argl12Cys, Arg158Arg and a method for amellorating atherosclerosis by altering the apo Al gene in a hepatocyte so that the altered protein can dimerize. Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo B, E and Algenes is used to treat or prevent atherosclerosis, coronary heart disease, Alzheinem's disease, hypobetalipoproteinemia, and dysbetalipoproteinemia. This sequence encodes the human Apo Al protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1386 ctcttctgagacagagtctcactgtgtggcccaggctagtctcaaacttgcggtccattt 1445

This invention describes a novel expression augmenting sequence element (EASE) (1) isolated from Chinese hanster cotary cells. (1) facilitates high expression of recombinant proteins in mammalian host cells in a short time period. (1) is used for improving expression of recombinant proteins 2-8 fold in stable cell pools when it is present in an expression vector. (1) improves recombinant protein expression in mammalian cells and facilitates the use of mammalian cells in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or ameliorating medical conditions of e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or amount of expression of the new polypeptides in a sample or by determining the presence or absence of mutations in the new polypuclectides. Specific uses are absence of mutations in the new polypuclectides. Specific uses are described for each of the 70 polynuclectides. Based on which tissues the most highly expressed in, and include developing products for the diagnosts or treatment of cancer, tumours, neurodegenerative clasorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, asthma, osteoprosis, arthritis, psoriasis, dispestive/endocrine disorders, inflammation are represented in 197744 + 9707850 and the encoding nucleic acids are

called human colon cancer antigens, given in B53234 to B54006. The human called human colon cancer antigens, given in B53234 to B54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; colon cancer antigens can have cytostatic, cardioactive, muscular; colon cancer immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent disorders, reproductive disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders. C98764 to C98772 and B54007 inceres.

This sequence represents a nucleic acid molecule designated Gene 101 from the human cDNA clone HLQAB52 (deposited as clone ATCC 97901 and ATCC 209047) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. V59502) for increasing the stability of the fused protein as compared to the human protein only:

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75026) which

ö
are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V59511 for described
                                                                                                    Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant valocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (q1|4732114|qplaF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into captured vector DNA, and transformed into captured vector DNA, and transformed into captured for amplicibil resistance."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."
